The polypeptide and the nucleic acid are useful for treating breast cancer, and diagnosing or monitoring the presence of metastases of breast cancer in a patient. The polymucleotides of the invention can be used to treat disorders by gene therapy. This polymucleotide represents a breast specific related sequence of the

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel colypeptides. Also claimed is a polypeptide encoded by the polymuclectide, immunologically assaying the polymeptide or peptide or tits partial peptide, immunologically assaying the polymeptide or peptide or tits partial peptide, immunologically assaying the polymeptide or peptide of the polymuclectide by contacting the polymeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymuclectide in an expressible manner and an antisense polymuclectide. The oligonuclectide or sa useful as a primer for synthesising the polymuclectide, or as a probe for detecting the polymuclectides and encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and adaptosetic marker or medicines for regulation of their expression and activity, or as targets of gene may be included in their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or call regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes cenceding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate cenceding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases) on of the encoded protein to creat diseases. The esequence presented is a cDNA of the invention. Note: Some of the sequence cata for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Otsuki T, Wakamatsu A, Sato H, Ishii S;

The present sequence is one of 1351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides. The probes can be used for chromosome mapping of the polymucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and the products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polymucleotides and proventive interventions. The polymucleotides, polypeptides and preventive them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia, dysplasia and hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 242

The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, they are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. This sequence encodes a lung specific nucleic acid
                                                                                                                                                                                                                                                                                           New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             533

                                                                                                                                                                                                                                                                                                                          The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-12421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. (HUMA-) HUMAN GENOME SCI INC

```
AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polymucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
cuplynucleotides may be used to produce the secreted (I), by inserting the
nucleic acids into a host cell and culturing the cell to express the
concern and cancer metastesses of haematopoietic-related diseases, especially
cancers and cancer metastesses of haematopoietic-derived cells. AAK64703
cancers and cancer metastesses of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169
crepresent sequences used in the exemplification of the present invention
                                                                Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.
                                                                                                                       Disclosure; SEQ ID NO 21882; 3071pp + Sequence Listing; English.

are associated with carcinomas. The sequences are useful for: (1) for screening drug candidates; (1i) for screening of bioactive agent capable of binding to Carcinoma Associated Protein (CAP); (1ii) for screening of a bioactive agent capable of modulating the activity of CAP; (1v) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (vii) for treating carcinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent
                                                                                     present invention relates to novel DNA and protein sequences which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US2002182586A1, for which no sequence data was published

(REAS-) RES ASSOC BIOTECHNOLOGY

```
The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morpid states. They are also useful for treating osteopropis, neurological diseases, Alzhaimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity to the nucleotide and protein sequences. ```
This invention relates to a novel method for modulating the expression of a target gene in a cell. Specifically, it refers to the introduction into a call of a polynucleotide that forms a duplex region with an mRNA transcribed from the target gene, where the duplex region with an mRNA transcribed from the target gene, where the duplex region comprises a mammalian miRNA at a post-transcriptional level. The present invention cell. differentiation of a mammalian cell, differentiation of a mammalian cell, differentiation of a mammalian cell in the post-transcriptional phase, which comprises mammalian cell in the post-transcriptional phase, which comprises introducing a plasmid vector comprising a promoter and nucleic acid molecule expressing an miRNA or siRNA silencing precursor to the miRNA. Accordingly, it provides a cell therapy method for treating cancer, immune disease, nerve disorder (e.g. amyotrophic lateral sclerosis, parkinson's disease, or Alzheimer's disease) or an inflammatory disease. By introducing into the cell the miRNA, siRNA silencing precursor to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating expression of a target gene in a cell, for treating cancer, an immune disease, or a nerve disorder, comprises introducing into the cell a polynucleotide that forms a duplex region with an mRNA transcribed from the target gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immune disease; nerve disorder; amyotrophic lateral sclerosis;

The invention relates to a novel method for in vitro detection of systemic inflammatory response syndrome (SIRS). The method comprises detecting abnormal expression of disease-related genes, or their associated peptides. The method of the invention demonstrates antibacterial, immunosuppressive and antiinflammatory applications and may be used for early differential diagnosis, monitoring progression, mortem diagnosis of systemic inflammatory response to treatment and for post mortem diagnosis of systemic inflammatory response syndrome, sepsis and sepsis-like conditions. The recombinant or synthetic nucleic acid sequences of the invention, or derived proteins or peptides, may be useful as calibrants in assays for the specified diseases, for evaluating activity or toxicity in screening for active agents and/or for preparation of agents for treatment or prevention of the specified diseases. The current sequence is that of a human SIRS/sepsis diagnostic
miRNA or the plasmid vector. As such, they can be developed into pharmaceutical compositions that exhibit cytostatic, immunosuppressive, nocropic, neuroprotective and antiinflammatory activities and hence can be used for immunocherapy. This polymucleotide sequence is a human target gene whose expression is modulated by miRNAs of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro detection of systemic inflammatory response syndrome and related conditions, for e.g. monitoring progression, comprises detecting abnormal expression of disease-related genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Deigner H;

(SIRS-) SIRS LAB GMBH.

Deigner Zipfel PF, Straube E, Saluz H, Russwurm S, Reinhart K, WPI; 2004-748070/73. In vitro detection of systemic inflammatory response syndrome and related conditions, for e.g. monitoring progression, comprises detecting abnormal expression of disease-related genes.

Disclosure; Page; 75pp; German.

The invention relates to a novel method for in vitro detection of systemic inflammatory response syndrome (SIRS). The method comprises detecting abnormal expression of disease-related genes, or their associated peptides. The method of the invention demonstrates antibacterial, immunosuppressive and antiinflammatory applications and may be used for early differential diagnosis, monitoring progression, assessing risk, assessing the likely response to treatment and for post mortem diagnosis of systemic inflammatory response syndrome, sepsis and sepsis-like conditions. The recombinant or synthetic nucleic acid sequences of the invention, or derived proteins or peptides, may be useful as calibrants in assays for the specified diseases, for evaluating activity or toxicity in screening for active agents and/or for

```
The present invention describes a polynucleotide library (I) useful in the molecular characterisation of a carcinoma, comprising a pool of polynucleotides or its subsequences which are either underexpressed or overexpressed in tumour cells, and correspond to any of the polynucleotide sequences chosen from the 468 sequences given in ABV94010 to ABV94477. Also described: (1) a polynucleotide array (II) useful for the prognosis or diagnostic of tumour, comprising (I); and (2) detecting (MI) differentially expressed polynucleotide sequences which are correlated with a cancer, involves obtaining a polynucleotide sample from a patient, and reacting the polynucleotide sample obtained with a probe
preparation of agents for treatment or prevention of the specified diseases. The current sequence is that of a human SIRS/sepsis diagnostic marker DNA fragment of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published part_sequences. Purthermore, a number of arbitrary SEQ ID No.s are disclosed within the specification, however, these have not been taken into account during indexing due to inconsistencies in application and

immobilised on a solid support, where the probe comprises any combination of the polymucleotide sequences of (1) or its expression products encoded by polymucleotide sequences of (1), and detecting the reaction product.

(I) have cytostatic activities and can be used as anti-tumour agence. (1) is useful in molecular characterisation of a carcinoma. (I) and (II) are useful for the prognosis or diagnostic of tumour, in differentiating a normal cell from a cancer cell, detecting a hormone sensitive tumour cell, differentiating a tumour with lymph nodes from a tumour without lymph nodes, differentiating antercycline-sensitive tumours, and classifying good and poor prognosis primary breast tumours, and classifying good and poor prognosis primary breast tumours. (1) is useful for large-scale molecular cancer treatment, and for detecting differentially expressed genes that correlated with a cancer

New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in a mammal.

Claim 1; SEQ ID NO 2426; 3069pp; English.

The invention relates to novel polynuclectide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynuclectides of the invention.

```
The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding forkhead box 01A, where the compound is at least 70% complementary to a nucleic acid molecule encoding forkhead box 01A and modulates expression of forkhead box 01A by at least 10%. The compound is useful for treating an animal having a disease or condition associated with forkhead box 01A, e.g. a hyperproliferative disorder (cancer, preferably rhabdomyosarcoma), or type 2 diabetes. This sequence corresponds to the human foxhead box 01A to which the oligonucleotides of the invention are targeted.
                                                                                                                                                                                                                                                                                                                              88; cytostatic; antidiabetic; foxhead box O1A inhibitor; forkhead box O1A; hyperproliferative disorder; cancer; rhabdomyosarcoma; diabetes; H-ras gene; antisense; gene expression.

The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least une doiling nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human forkhead box OlA polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer, preferably rhabdomyosarcoma, and type 2 diabetes. This sequence represents DNA encoding the human forkhead OlA polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         targeted to a for treating

the intention retains to numean tumour-associated antigenic target (1747) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide acquences at least 80% identical to the TAT nucleic acids and polypeptides, expression vectors and host cells comprising a TAT nucleic acids and polypeptides; an antibody specific for a TAT polypeptide; peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; an antibodis and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cancer, pancreatic cancer, cervical cancer, colorects of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                       Tumour-associated antigenic target (TAT) cDNA DNA270254, SEQ ID NO:3896.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or

The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comprises determining the expression profile of a group of markers in a

```
The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, ollogmers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

Claim 1; SEQ ID NO 10524; 103pp; English.

biodiversity.

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromesome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consists of (II) sequence (II) sequence tags for identifying expressed consists of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cuseful for generating antibodies against it, detecting or quantitating a cupypelement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forgentic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this conding sequence of the invention. Note: The sequence data for this conding sequence of the invention. Note: The sequence data for this conding sequence of the printed specification, but was obtained in all activity.

The present invention relates to the isolation of novel human polymentides exquences and their encoding polymentides. The novel polymentides exquences and their encoding polymentides. The novel polymentides exhibit activities relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antiinflammatory, and stem cell growth factor activities. The polymentides are involved in the confideration, differentiation and survival of pluripotent and totipotent stem cells, and are useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals and totipotent tissues. The polyment of bio-sensors. The polymential cells that can be used to augment or replace cells damaged by illness, autoimmune disease, used to augment or replace cells and regeneration of nerve and brain tissue and are useful for the treatment of central and peripheral nervous system diseases and neuropathelies, such as Alzheimer's parkhinson's disease, Huntington's disease, amyotrophic lateral sclerosis (ALS). The polymeptides are also involved in chemotactic or chemokinetic activity,
                                                                                                                                                                                                                                                                                 cell differentiation; totipotent; stem cell; transplantation; bio-sensor; neuroepithelial cell; autoimmune disease; neural cell; genetic disorder; nerve; brain tissue; central nervous system disease;

regulation of haematopoiesis and are useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia and cor for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, and periodontal disease. The polypeptides are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and disorders infections, autoimmuned disorders (e.g. multiple sclerosis, reperfusion infections, autoimmuned disorders (e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis), allergic reactions and conditions, such as asthma or other respiratory problems. The polypeptides are involved in thrombolysis or thrombosis and are useful in treatment of various coagulation disorders (including hereditary disorders such as haemophilia) or to enhance coagulation and other causes. The polypeptides exhibit immune stimulating or immune concerns in treating wounds resulting from treatme diseases or cancer. They also inhibit the growth, infection or function of infectious generic such as bacteria, fungi, viruses, effect blorhythms or circadian cycles of rhythms, fertility of male or female subjects, metabolism, catabolism, and anabolism. Achosest effect blorhythms or circadian cycles of rhythms, fertility of male or female subjects, metabolism, as seeds. Note:

The sequence data for this patent did not form part of the printed cycles of this patent did not form part of the printed presents in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; BST;
genome mapping; biodiversity; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Jones LW;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 239 BP; 39 A; 91 C; 59 G; 50 T; 0 U; 0 Other;

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisenses bus or the purified polypeptide is useful for generating antisense of the purified polypeptide is useful for generating antisead sequences. Note: The present sequence for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted protein; treatment; prevention; protein therapy; AIDS; gene therapy; diagnosis; cancer; tumour; neurodegenerative disorder; developmental abnormality; fetal deficiency; blood disorder; leukemia; immune system disease; autoimmune disease; hepatic disease; lymphoma; renal disease; inflammation; allergy; Alzheimer's disease; schizophrenia; cognitive disorder; prostate disease; skehetal; cardiac; muscle disorder; prostate disease; schebtal; cardiac; muscle disorder; pulmonary disorder; transplant rejection; osteoclast; osteoporosis; arthritis; malignancy; digestive; endocrine; infection; ss.
                                                                       polynucleotide sequences obtained from various cDNA libraries, useful
                                                                                          as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 496 BP; 108 A; 157 C; 121 G; 108 T; 0 U; 2 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human secreted protein cDNA fragment containing gene 63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             00000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     segdata.uspto.gov/sequence.html?DocID=20030073623
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length:

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides.

C Specific uses are described for each of the 101 polymucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, contendegenerative disorders, developmental abnormalities and fetal contendegenerative disorders, letkemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Albeimer's and cognitive disorders, pulmonary disorders, clasease, skeletal or cardiac muscle disorders, pulmonary disorders, cramsplant rejection, disorders involving ostecolasts such as costeoporosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS: The human secreted proteins of the invention are represented in AAX37451-X37552
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Central nervous system, CNS; autoimmune disease, rheumatoid arthritis; hyperproliferative disorder; neoplasm; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; ischaemia; angiogenesis; nervous system disorder; Alzheimer's disease; AIDS; ocular disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-SEP-2000
                                                                                                                                        02-AUG-2001
    The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (II), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include cautoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders c.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease and anglogenesis, nervous system disorders e.g. Alzheimer's disease and amplotrophic lateral sclerosis, infections caused by bacteria, viruses c.g. corneal infection, gastrointesinal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. corneal infection, gastrointesinal disorders e.g. dysphagia, cancers and disorders e.g. malignancies, and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders involving neovascularisation e.g. malignancies, respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. respiratory disorders e.g. nonallergic chinitis, renal disorders e.g. cette kidney failure and blood related disorders e.g. myocardial cinfarction. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The colypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,
                                                                                                                                                                                                                                                       New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; foetal tissue antigen; ss; antiinflammatory; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunomodulator; cardiovascular; cytostatic; nephrothropic;

                                                                                                                                                                                                                                                                                                                   NOV-2
```

```
The invention relates to novel mucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or amellorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (EIISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. Conservation, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial corders before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease consore as a food additive or preservative to increase or decrease consore examples of diseases and disorders treated by the nucleic acids and corders are given in the specification. The present sequence encodes a content of the invention. One sequence data for this patent content of the present sequence data for this patent content in the specification, but was obtained in
                                                                                                                                                                                                     New polynucleotides and polypeptides for diagnosing, treating, preventing or prognosing e.g. diseases or disorders of the nervous, musculoskeletal, excretory, gastrointestinal, reproductive, and respiratory systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 da; gene; immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmological; gene therapy; channel/transporter protein; rheumatoid arthritis; neoplasm; cardiac arrest; cerebrovascular disorder; cerebral ischemia; angiogenesis, nervous system disorder; Alzheimer's disease; ocular disorder; corneal infection; wound healing; epithelial cell proliferation; skin aging; sumburn; transplantation;

 The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 954 identical to a these. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to displancing a pathological condition or susceptibility to a complete of a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic in alleviating symptoms associated with the disorders and in diagnostic (BLISA). Disorders which are diagnosed or treated immunosorbent assays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. carchiac arrest, cerebrovascular disorders e.g. cerebral ischemia, angiogenesis, carcest, cerebrovascular disorders e.g. cerebral infections caused by actreat or lives, and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxie. The polypeptides can also be used additive or preservative to increase or decrease conservative conservative to the center of primary conservative conservative to increase or decrease conservative con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antidiabetic; antirheumatic; antiarthritic; dermatological; antirheumatic; antiarthritic; dermatological; antirheumatory; immunosuppressive; antithyroid; antianemic; vasotropic; anti-HIV; hepatokropic; virucide; antibacterial; fungicide; antiparastic; muscular; gynaecological; gastrointestinal; respiratory; cardiovascular; antiarteriosclerotic; antiarrhythmic; cardiant; nephrotropic; litholytic; cytostatic; gene therapy; neural disorder; Alzheimer; disease; Parkinson's disease; huntington's chorea; amyotrophic lateral sclerosis; multiple sclerosis; immune system disorder; diabetes; rheumatoid arthritis; systemic lupus erythematosus; autoimmune thyroiditis; haemolytic anaemia;
                                                                                                                                      Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neuroprotective; nootropic; antiparkinsonian; anticonvulsant;

The invention describes an isolated polypeptide comprising an amino acid sequence at least 90% identical to: a polypeptide fragment, domain, epitope, or full-length protein of any one of 607 amino acid sequences (I) described in the specification; a polypeptide fragment of (I), or the encoded sequence contained in (II), having biological activity; or a variant, allelic variant, or a species homologue of (I). The polypeptides and nucleic acid molecules are useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions such as neural disorders, e.g. Alzheimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis,
                                                                                                                                                                                                                                                        New polypeptides and nucleic acid molecules, useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions e.g. neural disorders, reproductive disorders or infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antidecterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins antissues disclosed in the specification. The nucleic acids, proteins antissues disclosed in the specification. The diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, lurg, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycocardial ischaemias; (d) wound healing infections diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases e.g. viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; sheep; pig; cow; fruit fly; yeast; hamster; macaque; horse; tomato; monkey; dog; sea urchin; expressed sequence tag; BST; diagnostics; forensic test; gene mapping; genetic disorder; biodiversity; gene therapy; nutrition; ss.

proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     plant; gene; ss; transcription; plant genome augmentation; cereal; soybean; alfalfa; sunflower; canola; cotton; peanut; tobacco; sugar beet; maize; barley; sorghum; rice; wheat; crop plant; insecticide resistance; stress tolerance; salt tolerance; cold tolerance; drought tolerance; plant nutrition; apical dominance; dwarfism; early flowering; antiviral; antifungal.

The invention relates to plant nucleotide sequences that direct seed, leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential or constitutive transcription of an operatively linked nucleic acid cor constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polynucleotides and the polypeptides they sorghum, rice or wheat. The polynucleotides and the polypeptides they sorghum, rice or wheat. The polynucleotides and the polypeptides they sorghum, rice or wheat. The polynucleotides and the polypeptides they sorghum, rice or waster to masteriate to a manipulating crop plants to an improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or fungi, and to incur stress tolerance (e.g. salt, cold or drought) to ensure the plants incur stress tolerance (e.g. salt, cold or drought) to ensure the plants early flowering or altered metabolic pathways. This sequence represents a plant nucleic acid of the invention. Note: The sequence dare for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at segdata.uspto.gov/seguence.html.
                                                                                                                                                                                                                                                                                                                                                                                                New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities of oil or proteins, resistance to insecticides, virus or fungi, stress tolerance
                                                                                                                                                                                                                                                                                  T, Briggs SP, Cooper B, Glazebrook J;

Life and/or stem. Definition of an operatively linked nucleic security.

Leaf- and/or stem. panicle. root- or pollen-specific or -preferential

or constitutive transcription of an operatively linked nucleic acid

segment. The invention also relates to a method for augmenting a plant

considered in the seed, leaf, stem, panicle, pollen, root or is constitutive

altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

calcard, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

corpum, rice or wheat. The polymucleotides and the polypeptides they

corpum, rice or wheat. The polymucleotides and the polypeptides they

corpus are useful for manipulating crop plants to alter or improve

phenotypic characteristies, to produce large quantities of oil or

proteins, to incur resistance to insecticides, viruses or fungi, and to

concern to incur resistance to insecticides, viruses or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insecticides, rices or fungi, and to

concern to incur resistance to insection described to conserve the plants

concern to incur resistance to insection to the plants

concern to incur resistance to insection to the plants

AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthric; immunosuppressive; antibacterial; endocrine; cardiant; cardiant; cardiant; cardiant; cardiant; cardiant; antianaemic; antiagoregant; haemostatic; vulnerary; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; cardiactan; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; cording them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polymucleotides are useful for screening for sponists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections autoimmunity, genetic diseases, haematopoietic disorders, cancer, multiple sclerosis, depression, hinitis asthma, diabetes, cancer, multiple sclerosis, depression, hinitis, asthma, diabetes, cancer, multiple sclerosis, depression, hinitis, asthma disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated human polynucleotides encoding polypeptides, useful for the treatment and diagnosis of e.g. cancer, ulcers and HIV infection.
                                                                                                                                                    Human protein encoding cDNA sequence SEQ ID NO:280.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 421; 1217pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to plant nucleotide sequences that direct seed-, leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                   Plant; gene; ss; transcription; plant genome augmentation; cereal;

genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polymuclectides and the polypeptides they encode are useful for manipulating crop plants to alter or improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or fungi, and to incur stress tolerance (e.g. salt, cold or drought) to ensure the plants have a high nutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence represents a plant nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html. \$

Compositions for treating and diagnosing cancer, contain agents that inhibit activity or expression of specific tumor-associated antigens, or bind to these antigens or nucleic acid encoding them. Claim 1; SEQ ID NO 69; 388pp; German.

This invention relates to a novel pharmaceutical composition which comprises an agent that inhibits the activity or expression of a specific tumor-associated antigen (TAg). Specifically, it relates to tumor-associated antigens that are encoded by one of the following 75 nucleic acida sequences, fragments or derivatives thereof as given in the specification. The present invention describes antisense nucleic acids

that hybridize to these TAg polynucleotides that may be used for antisense therapy and RNA interference, as well as methods for diagnosing a disease associated with (abnormal) expression of TAG. Accordingly, it further relates to methods for determining regression, progression and onset of a disease by administering an antibody, optionally linked to a therapeutic or diagnostic agent, that binds to TAG. As such, cytostatic compositions derived thereof are used for treating a wide range of cancers and their metastases, where the agents that bind specifically to TAG, and the nucleir acids that encode them, are useful for diagnosis and monitoring. This polynucleotide is a human DNA sequence encoding a tumor associated antigenic protein of the invention. New genes that are up- or down-regulated in colorectal cancer, useful for diagnosing colorectal cancer in a subject, or for identifying modulators of colorectal cancer-associated proteins and genes for treating colorectal cancer. ```
The present sequence is the nucleotide sequence of a human gene that exhibits increased expression in metastatic colorectal cancer (MCC) samples. The gene is up-regulated in colon cancer-derived metastases compared to normal colon tissue. It is an example of claimed nucleic acid molecules that are up- or down-regulated in metastatic colorectal cancer cells. Such MCC-associated nucleic acids are useful in diagnostic and prognostic applications, in screening applications e.g. blochips, for identification of variant MCC-associated sequences, in informatics, for expression of MCC-associated proteins, in drug screening assays for identification of modulators of MCC-associated proteins, which are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting the growth or proliferation of a colon neoplasia in a subject, for treating colon cancer, comprises administering to the subject an agent that decreases the amount of a polypeptide present in or produced

the colon neoplasia

```
The present sequence is the nucleic acid sequence of ColoUps a molecular marker of colon neoplasia. ColoUps was identified by expression microarray profiling of genes showing differential expression in normal colon and metastatic colon cancer. ColoUps is referred to in the literature as FoxQl (Forkhead box subclass q, member 1, formerly known as HPH-1), which plays a role in tissue-specific gene regulation as development, cell cycle regulation, cell signalling and tumourigenesis. The molecular marker is useful in the detection or diagnosis of colon neoplasia and for categorising the neoplastic state of a patient. Methods for inhibiting the growth or proliferation of a colon neoplasia involve the use of short interfering RNA (siRNA) or antisense oligonucleotides, can an agent that binds to and antagonises the polypeptide. Molecular markers can also be used to taxget therapeutic agents to cells of a colon neoplasia, and to screen and identify candidate therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel molecular markers for categorizing the neoplastic state of a patient. The invention further comprises a method for detecting whether a subject is likely to have a colon neoplasia. The method comprises: obtaining a biological sample from the subject; detecting one or more polypeptides selected from among: one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         molecular marker; neoplastic state; colon neoplasia; ColoUp1; ColoUp2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting likeliness of subject to have colon neoplasia, involves obtaining biological sample from subject, detecting one or more of ColoUpl and ColoUp2 polypeptides, presence of polypeptide indicating
                                                                                                                                                                                                                                                                                                    Sequence 1209 BP; 150 A; 485 C; 432 G; 141 T; 0 U; 1 Other;

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 1850-9691 represent a set of about 7842 genes or partial genes from the genome of the bacterium Mxyococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
Coloupl polypeptides and one or more Coloup2 polypeptides, wherein the presence of said one or more polypeptides is indicative of colon neoplasia. The invention further comprises a kit for carrying out the said method. The methods and compositions are useful for detecting colon cancer. This polynucleotide sequence represents the Coloups gene of the

                                                                                                                                                                                                                                                                                                                    RESULT 45
                                                                                                                                                                                                                                                                                                                                                            ABK43589
                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 95% identical to a these. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to dispin such a pathological condition or susceptibility to a cast of pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic in alleviating symptoms associated with the disorders and in diagnostic memunoscasays or enzyme linked immunosorbent assays (BLISA). Disorders which are diagnosed or treated immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. corporating carrest, cerebrovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. or cracial infections caused by arrest, or truses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in Chemotaxie. The polypeptides can also be used as a food additive or preservative to increase or decrease contact the corporation of the preservative to increase or decrease encorporation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1553 BP; 480 A; 314 C; 313 G; 444 T; 0 U; 2 Other;

New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 1; SEQ ID NO 179; 837pp; English

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (II), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, system disorders e.g. cardiac arrest, orelarial solates in anylogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses e.g. Acquired immunodeficiency virus (AIDS) and fundi, ocular disorders e.g. corneal infection, gastrointestinal disorders e.g. disphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders e.g. nonallargatic rhinitis, renal disorders e.g. caute kidney failure and blood related disorders e.g. myocardial infarction. The polypeptides can also be used to aid wound healing and ceptimal organs before transplantation, for supporting cell culture of primary tissues. to regenerate tissues and in chemotaxis. The collin, protein, coprimary tissues can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

```
The invention describes an isolated polypeptide comprising an amino acid sequence at least 90% identical to: a polypeptide fragment, domain, epitope, or full-length protein of any one of 607 amino acid sequences (I) described in the specification; a polypeptide fragment of (I), or the encoded sequence contained in (II), having biological activity; or a variant, allelic variant, or a species homologue of (I). The polypeptides and nucleic acid molecules are useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions such as neural disorders, e.g. Alzheimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptides and nucleic acid molecules, useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medic conditions e.g. neural disorders, reproductive disorders or infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 179; 413pp; English.

US-09-989-890-238 (1-212) x ADI53976 (1-1564)

disorder characterised by an absence of, inappropriate or unwa-expression of the protein. The sequence presented is the human transporter protein cDNA

Sequence 1644 BP; 389 A; 419 C; 374 G; 462 T; 0 U; 0 Other;

```
the invention undertobe an isolated number to perpetation.

Its allelic variants or orthologues, number polymucleotides encoding them. Transporter proteins regulate many different functions of the cell, including cell proliferation, differentiation and signalling processes, by regulating the flow of molecules, such as ions and macromolecules, into and out of cells. The polymucleotide and polymeptide can be used to craise antibodies, create a gene chip, create a transperic can be used to animal, produce the novel polypeptide, detect the presence of the polypeptide or nucleic acid in a sample, identify a modulator of the polypeptide or the expression, identify a pharmaceutical composition, and carrier, that binds to the polypeptide and treat a disease or condition mediated by a human transporter protein which comprises administering to mediated by a human transporter protein which comprises administering to a patient the composition in the development of human therapeutics and diagnostic compositions. The peptides are also useful for eliciting an immune response, to quantitatively determine levels of the protein (or its binding partner or ligand) in biological fluids or as markers for tissues in which the corresponding protein is preferentially expressed. The agents identified are useful for treating to the agents identified are useful for treating to conditions and a modulator of the peptide is also useful for treating a disorder characterised by an absence of, inappropriate or unwanted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated human transporter proteins, useful for developing therapeutic or diagnostic compositions, particularly for developing human therapeutic agents that modulate transporter activity in cells or

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest, and for constructing mutations in a gene set of about 7842 genes or partial genes from the genome of the bacterium Mxyococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.

The present invention provides the protein and coding sequences of a number of human transporter and ion channel proteins, designated TRICH-1-TRICH-3. The sequences can be used in the treatment of transport, neurological, muscle, immunological and cell proliferative disorders. The present sequence is a coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human transporters and ion channel polypeptides for diagnosing, treating or preventing transport, neurological, muscle, immunological and

The present invention relates to a nucleic acid molecule encoding a UST3-LIKE1 or its regulator is useful for the treatment of gastrointestinal and liver diseases, metabolic diseases, hematological disorders, respiratory diseases, neurological disorders, usological disorders and cardiovascular diseases in a mammal. The regulator is a man and molecule, an RNA molecule, an antisease oligonucleotide, a polypeptide, an antishody, or a ribozyme. The disorders include liver cirrhogis, liver tumours, achalasia, dysphagia, gastroesophageal reflux, diabetes, crohn's disease, diarrhes, constipation, osteoporosis, Alzheimer's disease, Parkinson's disease, anemia, leukemia, lymphomas, asthma, allergies, stroke, dementia and arrhythmias. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule encoding an organic anion transporting (OAT)-
like protein UST3-LIKE1, useful for treating gastrointestinal, metabolic,
respiratory, neurological and cardiovascular diseases.

The invention may be useful for the production of compounds with a neuroprotective, relaxant, antithyroid, antidiabetic, cytostatic, dermatological, immunosuppressive, autiinflammatory, thyromimetic, antiallergic, creebroprotective, gastrointestinal, hepatotropic, nephrotropic, anticonvulsant, antiparkinsonian, antibacterial, antiparsitic, fungicide, protozoacide, virucide, uropathic, antitheumatic, cardiant, cardiant, cardiant, anti-HIV or nootropic activity acting as TRICH agonists or antagonists. In addition the disclosed sequences may be useful for gene therapy. The invention may be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hafalia AJA, Khare R, Lal PG, Yue H, Baughn MR, Thornton MB; Lu DAM, Ison CH, Becha SD, Ding L, Warren BA, Lee SY, Swarnakar A; Elliott VS, Richardson TW, Marquis JP, Ramkumar J, Murage J; Raumann BE, Yao MG, Lu Y, Gietzen KJ, Yang YG, Chang H, Chawla NK; Tran UK, Lee S, Yang J, Gandhi AR, Tribouley CM, Policky JL; Ring HZ, Lee EA;

diagnosing, preventing, and treating disorders associated with an abnormal expression or activity of TRICH, such as neurodegenerative disorders (for example Parkinson's disease, Alzheimer's disease), muscular disorders (for example myotonic dystrophy, catatonia), endocrine disorders (for example diabetes, Grave's disease), cancers (for example eleukaemia, carvical or breast cancers), immunological disorders (for example electoderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (for example Crohn's disease), renal disorders (for example Goodpasture's syndrome), infections (for example viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (for example atherosclerosis), or hepatic diseases (for example cirrhosis); TRICH or its fragments may also be used in screening for compounds that specifically bind to and modulate the activity of TRICH. The nucleotides can be used to create humanised animals or transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      animals to model human disease. The present sequence is that of a human transporter and ion channel (TRICH) gene of the invention.

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a

Homo sapiens

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention alos relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant baving an improved property. The plant is a crop plant cancer and growing at pransformed plant to such as maize or soybean. The method of producing a transformed plant to excombinant DNA construct and growing the transformed plant with the polymucleotide or polypeptide is useful for improving plant with the compinant DNA construct is useful for improving plants with construct is useful for improving plants with construct is useful for producing plants with construct properties, e.g. improved plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or peats, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved light production of photosynthesis or by providing improved light production or improved galactomannan condition, improved light production or improved data for this patent did the scope of the invention. Note: The sequence cata for this patent did cont form part of the printed specification but was obtained in electronic format from USPTO at sequence. The sequence cata for this patent did contains.
microbial source, useful for producing plants with improved properties.
                                                                Claim 1; SEQ ID NO 26078; 122pp; English.

```
This invention relates to novel human transporters and ion channel

(TRICH) proteins and the nucleotide sequences which encode them. The

invention may be useful for the production of compounds with a

curvention may be useful for the production of compounds with a

neuroprotective, relaxant, antithyroid, antidiabetic, cytostatic,

dermatological, immunosuppressive, antiinflammatory, thyromimetic,

cardial cardiant, cardiant, antiparkinsonian, antibacterial,

matiparasitic, fungicide, protozoacide, virucide, uropathic,

antiparasitic, cardiant, cardiavascular, anti-HIV or nootropic,

antiparasitic, cardiant, cardiavascular, anti-HIV or nootropic,

antiparasitic, cardiant, cardiavascular, anti-HIV or nootropic,

acting as TRICH agonists or antagonists. In addition the disclosed

carding as reventing, and treating disorders associated with an

cappormal expression or activity of TRICH, such as neurodegenerative

cappormal expression or activity of TRICH, such as neurodegenerative

cappormal expression or activity of disease, Alzheimer's disease),

capporders (for example parkinson's disease, Alzheimer's disease),

capporders (for example myotonic dystrophy, cardional, endocrine

disorders (for example diabetes, grave's disease), cancers (for

example soleroderma, systemic lupus erythematosus, allergies),

capporders (for example atheroselerosi), immunological disorders

(for example Goodpasture's syndrome), infections (for example viral,

capporders (for example atheroselerosis), or hepatic diseases (for example

carrhosis). TRICH or its fragments may also be used in screening for

cirrhosis). TRICH or its fragments may also be used in screening for

compounds that specifically bind to and modulate the activity of TRICH.

The nucleotides can be used to create humanised animals to a human

compounds the present sequence is that of a human

compounds the present sequence of the invention.

RESULT 55

```
The present invention provides the protein and coding sequences of a number of human transporter and ion channel proteins, designated TRICH-1-TRICH-32. The sequences can be used in the treatment of transport, neurological, muscle, immunological and cell proliferative disorders. The present sequence is a coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human transporters and ion channel polypeptides for diagnosing, treating or preventing transport, neurological, muscle, immunological and cell proliferative disorders.
                                                                                                                                                                                                                                                        Human; transporter and ion channel; TRICH; transport disorder; neurological disorder; muscle disorder; immunological disorder; cell proliferative disorder, neuroprotective, nootropic; cerbroprotective; immunosuppressive; cytostatic; respiratory; muscular;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed centry of (II) as useful in gene therapy techniques to restore normal certivity of (II) or to tread disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging convolving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, foresists, generations in displance other types of data and products dependent on DNA and the produce other types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the produce of the types of data and products dependent on DNA and the products dependent on DNA a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, dastrointestinal disorder, or consecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline to gene therapy. The present sequence represente a dithp polymorleotide of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gietzen D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                   gene; gene therapy; human diagnostic and therapeutic polynucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Harthshorne TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV; Mooney EM, Delegeane AM, Panesar IS, Banville SC, Reddy TP; Stevens KA, Blanchard JL, Panezer SK, Wang X, Au AP, Gerstin EH; Peralta CH, Anderson SB, Rioux P, Shen EJ, Wu MC, Stuve LL; Lagace RE, Spiro PA, Stewart EA, Wingrove J, Vitt UA, Kirton ES; Xu Y, Kwong M, Policky JL, Hurwitz BL, Ma Y, Jackson JL, Gletze Patury S, Shi X, Suarez CJ;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transgenic plant; DNA replication; gene regulation; gene expression; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in clucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins (ABB573737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest sequences given in records for SEQ IDs 1-1849 represent a set of 1849 contig and singleton sequences comprising coding sequences, the genements, promoters and other regulatory elements from the geneme of the bacterium Mayococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                              New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; respiratory antigen; respiratory disorder; throat disorder; lung disorder; nose disorder; lung cancer; gene therapy; cytostatic; anti allergic; anti asthmatic; anti inflammatory; olfactory; respiratory active; ds.

The present invention relates to the isolation of novel human respiratory antigens (AAU17685-AAU17975), and cDNA and genomic sequences encoding for these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the respiratory system including throat disorders (e.g. vocal cord paralysis, consillitis, and laryngitis), lung disorders e.g. pneumonia, allergic disorders e.g. asthma, pleurisy, cystic fibrosis, emphysema, nose clisorders and cancers of the respiratory tissues e.g. lung cancer. The polynucleotide sequences of the invention are useful in gene therapy and antisense therapy. AAS28161-AAS28764 represent genomic sequences encoding for novel human respiratory antigens. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; respiratory antigen; respiratory disorder; throat disorder; lung disorder; nose disorder; lung cancer; gene therapy; cytostatic; anti allergic; anti asthmatic; anti inflammatory; olfactory; respiratory active; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genomic sequence #366 encoding for novel human respiratory antigen.
                                                                                                                                                                                                                                                                         Sequence 7880 BP; 1588 A; 2332 C; 2092 G; 1868 T; 0 U; 0 Other;

prognosing respiratory cancers Isolated polypeptide for treating, preventing and/ or disorders related to the respiratory system including and also for testing and detection e.g. diagnosis.

Disclosure; SED ID No 960; 546pp; English.

The present invention relates to the isolation of novel human respiratory antigens (AAU17685-AAU17975), and cDNA and genomic sequences encoding for these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the tonsillitis, and laryngitis), lung disorders e.g. vocal cord paralysis, tonsillitis, and laryngitis), lung disorders e.g. pneumonia, allergic disorders and cancers of the respiratory tissues e.g. lung cancer. The polynucleotide sequences of the invention are useful in gene therapy and antisense therapy. AAS28161-AAS2876 represent genomic sequences encoding for novel human respiratory antigens. Note: The sequence encoding for more form part of the printed specification, but was obtained in electronic format directly from WIPO at

techniques, for chromosome identification, identifying individuals from

```
The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of PS, full-length protein of PS, or variant, alledic variant or species homolog of PS. (I) cr a polymucleotide (II) encoding (I) is also useful for diagnosing a pathological condition or a uscreptibility to a pathological condition in a subject which involves determining the presence or absence of mutation in a subject which involves determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a biological sample and diagnosing a pathological condition based on the result. The human respiratory system associated polynucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., pneumonia), allergic disorders, (e.g., asthma and eosinophilic pneumonia), pleurisy, cystic fibrosis, emphysema, histicoyfosis, pneumonia), pleurisy, cystic fibrosis, emphysema, histicoyfosis, sarcoidosis, nose disorders (thinitis and larymoitis), neoplasms and/or cancers of respiratory tissues (e.g., throat cancer, lung cancer, and cancer of the nose). The polymucleotides are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; SEQ ID NO 961; 236pp; English.

Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat cancer.

Disclosure; SEQ ID NO 960; 236pp; English.

The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of PS, full-length biological activity, polypeptide domain or species homolog of PS. (I) cordition or a susceptibility to a pathological condition in a subject which involves determining the presence or absence of mutation a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or cault. The human respiratory system associated polymucleotides, the creatiff of diagnosing a pathological condition based on the result. The human respiratory system associated polymucleotides, the collypeptides are useful in diagnosis, treatment, prevention and/or these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., pneumonia), allergic disorders, (e.g., asthma and ecosinophilic pneumonia), pleurisy, cystic fibrosis, emphysema, histiocytosis, arcoidosis, nose disorders (rhinitis and sinusitis), neoplasms and/or cancers of respiratory tissues (e.g., throat cancer, lung cancer, and cancers of the nose). The polymucleotides are useful in gene therapy techniques, for chromosome identification, identifying individuals from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention is related to a novel isolated polypeptide, which comprises a human respiratory system-related polypeptide, and the DNA sequence which encodes it. The invention may be useful for the sequence which encodes it. The invention may be useful for the development of compounds with an antisathmatic, antibacterial, antibitation, the sequences disclosed may be useful for gene therapy. The polypeptide or polymouleotide is useful for treating, preventing or polypeptide or polymouleotide is useful for treating, preventing or medical condition, for example pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, anaemia, leukaemia, inflammations, sinusitis, chronic obstructive pulmonary disease or inflammations, sinusitis, chronic obstructive pulmonary disease or inflammations diseases. The polypeptide or polymorary disease or diseases. The polypeptide or polymorary disease. The disease or a susceptibility to the disease. The present sequence is that of a human DNA sequence which is related to a human respiratory system associated gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human respiratory system-related polypeptide and genes, useful for treating, preventing or diagnosing e.g. pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, leukemia, inflammations or sinusitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 7880 BP; 1588 A; 2332 C; 2092 G; 1868 T; 0 U; 0 Other;

This invention is related to a novel isolated polypeptide, which comprises a human respiratory system-related polypeptide, and the DNA sequence which encodes it. The invention may be useful for the development of compounds with an antiasthmatic, antibacterial, antiinflammatory, cytostatic, antianaemic or antiallergic activity. In addition, the sequences disclosed may be useful for gene therapy. The polypeptide or polymucleotide is useful for treating, preventing or ameliorating a medical condition, for example pneumonia, lung cancer, cystic fibrosis, astromic obstructive pulmonary disease or infectious diseases. The polypeptide or polymucleotide is also useful for infectious diseases. The polypeptide or polymucleotide is also useful for diagnosing any of these diseases or a susceptibility to the disease. The present sequence is that of a human DNA sequence which is related to a human respiratory system associated gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transgenic plant; DNA replication; gene regulation; gene expression; ds.
                                                                                                                                                                                                                                                                                                                                                                   New human respiratory system-related polypeptide and genes, useful for treating, preventing or diagnosing e.g. pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, leukemia, inflammations or sinusitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 7880 BP; 1588 A; 2333 C; 2091 G; 1868 T; 0 U; 0 Other;

```
The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11956. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest. Sequences given in records for SEQ IDs 1-1849 represent a set of 1849 contig and singleton sequences comprising coding sequences, DNA replication elements, promoters and other regulatory elements from the genome of the bacterium Mayococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was
                                                                                                                                                                                                                                                         New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding protein differentially regulated in prostate cancer #63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prostate cancer; gene expression; differential regulation; molecular marker; drug target; cancer detection; cancer diagnosis; cancer staging; cancer grading; cancer assessing; cancer monitoring;

corrections genes (1) with a section of the propagation of the number of prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of the probability that the sample comprises of target genes which are differentially regulated in the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves a subject having a prostate cancer, which involves cancer of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, diagnosing, staging, grading, assessing, monitoring, prognosticating, prognosticating, prognosticating, products are used in the diagnostic test to assay for presence of cancer conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer conditions especially relating for prostate cancer. (I) and its expression of cancer, its stage of development, the nature of genetic act.

The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus for specific genes, and groups of genes, expressed in pathways in pathways and disease pathways and the delineation of targets in these pathways which are useful in disease pathways and the delineation of targets in the app

                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a new combination which comprises cDNAs or their complements not given in the specification that are differentially expressed in vascular endothelium. The combination of cDNAs is useful for preparing a composition for diagnosing or treating vascular disorder, comprising atherosclerosis, haemangioma, haemangioendothelioma, oedema,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         diabetic retinopathy, warts, pyogenic granulomas, Kaposi's sarcoma, scar keloids, allergic oedema, neoplasms, pioriaals ulcers, follicular cysts, endometriosis, peritoneal sclerosis or obesity. The present sequence represents a cDNA differentially expressed in the vascular endothelium.
                                                                                                                                                                                                                                                                                                                                     New combination comprising cDNAs that are differentially expressed in vascular endothelium, useful for preparing a composition for diagnosing or treating vascular disorder, e.g., atherosclerosis, psoriasis, ulcers
                                                                             wart;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Murine cDNA differentially expressed in MYCN activated cells SeqID 349.
                                         Human cDNA differentially expressed in the vascular endothelium #262

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymucleotida sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protonon cells activated by the transactivator MYCN, where MYCN is a protonon cogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, well as for screening assays by identifying molecules or compounds that specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the US Patent Office at
differential expression; transactivator; proto-oncogene; small cell lung cancer; cytostatic; gene therapy; ss; cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment represents a cDNA connective.

Human steroid-induced C3A liver cell cDNA #21.

```
The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high troughput method of screening molecules or compounds to identify a throughput method of screening molecules or compounds to identify a wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises combining the combination with molecules or compounds under conditions to allow specific binding; and detecting specific binding between each cDNA and at cast one molecule or compound. The molecules or compounds are regulatory proteins. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human cDNA which is differentially expressed in steroid-induced C3A liver calls. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                              Combination useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis, comprises cDNAs that are differentially expressed in response to steroid

The composition is useful for diagnosing, staging or treating prostate cancer or for monitoring the treatment of a subject with prostate cancer. The invention is also used in gene therapy. The present sequence is the human cDNA differentially

differentially expressed in prostate cancer. The composition of the invention useful for a high-throughput method for detecting differential expression of cDNAs in a nucleic acid containing sample comprising amplifying the nucleic acids of the sample, hybridishing the composition with nucleic acids of the sample, hybridishing the composition of and comparing the complexes with those of a standard, where differences and comparing the composition The sample is from a subject with composition of compounds to differential expression. The sample is from a subject with confidence differential expression with a standard defines an early, mid or late stage of the disease. The composition and or protein encoded by the compounds to identify a ligand which specifically binds a CDNA or protein compounds to identify a ligand which specifically binds a CDNA or protein compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules and compounds are selected from DNA, RNA, peptide nucleic acid molecules inhibitors, drug compounds, pharmaceutical agents, transcription factors, repressors, and regulatory proteins. The composition is useful for the diagnosis of prostate cancer. The antibodies are also useful for the diagnosis of disease. This sequence represents a prostate adenocarcinoma cDNA
                                                                                                                                                                                                                                                                          invention describes a composition of a number of human cDNAs that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma; thyroid tumour; MEL3; MEL7; Thy5; Thy6; Thy11; Thy14; Thy15; rectal cancer; lung cancer; breast cancer; colon cancer; antibody Ki-67;
New composition, useful for treating and diagnosing prostate cancer, comprises human cDNAs that are differentially expressed in prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA sequence encoding the antigen of monoclonal antibody Ki-67.
